

REMARKS

Entry of the amendments to the specification, claims and abstract before examination of the application is respectfully requested. These claims have been amended to remove multiple dependencies and these claims patentably define over the art of record.

If there are any questions regarding this Preliminary Amendment or the application in general, a telephone call to the undersigned would be appreciated since this should expedite the prosecution of the application for all concerned.

If necessary to effect a timely response, this paper should be considered as a petition for an Extension of Time sufficient to effect a timely response, and please charge any deficiency in fees or credit any overpayments to Deposit Account No. 05-1323 (Docket # 095309.57637US).

Respectfully submitted,

Gary R. Edwards

IAP20 Rec'd PCT/PTO 27 APR 2006

~~Tool and method for cutting a hollow profile~~5 TOOL AND METHOD FOR CUTTING A HOLLOW PROFILEBACKGROUND AND SUMMARY OF THE INVENTION

10 This application is a National Phase of
PCT/EP2004/011454, filed October 13, 2004, which claims
the priority of German patent document DE 103 50 156.8,
filed October 28, 2003, the disclosure of which is
expressly incorporated by reference herein.

15 The invention relates to a [[tool]] method and
apparatus for cutting a hollow body profile ~~according~~
~~to the preamble of claim 1 and to an associated method~~
~~according to the preamble of claim 9.~~

20 German patent document DE 197 24 037 C2 discloses such
a method and ~~such a device for cutting a hollow body.~~
~~The known method is based on the combined application~~
~~of apparatus, which uses~~ mechanical cutting of a flange
on the hollow body along a first cutting edge and
25 [[of]] internal high pressure cutting along a second
cutting edge. ~~In this case, the~~ The fact that the
hollow body is deformed according to the internal high
pressure forming process is utilized to the effect that
the hollow body is severed transversely to its
30 longitudinal extent preferably after internal high
pressure forming has already been ~~effeeted~~ performed.
During internal high pressure forming, a side of a
cutting device which faces the hollow body is used for
cutting the flange, ~~this side facing the hollow body,~~
35 and serves as a die wall, against which the hollow body
bears during the internal high pressure forming.

A device or a method of this type is based on the general idea of designing a tool both for cutting a flange on a hollow profile and for forming the hollow profile according to the internal high pressure forming process~~[[, the]]~~. The tool ~~having~~ has at least one cutting device which is displaceable in the transverse direction of the hollow profile and runs parallel to ~~[[the]]~~ its longitudinal extent. A side of the cutting device facing the hollow profile is ~~in this case~~ designed as a shaping die wall, against which the hollow profile bears after the cutting operation and during the internal high pressure forming following ~~[[said]]~~ the cutting operation.

With a cutting edge formed on the cutting device, the tool therefore at least partly cuts off a flange, running in the longitudinal direction of the hollow profile, parallel to the longitudinal direction by displacing the cutting edge ~~being displaced~~ in the transverse direction of the hollow profile. After the flange has been cut off, ~~[[that]]~~ the side of the device which faces the hollow profile is utilized as a shaping die wall, whose outer side bears against ~~[[which]]~~ the hollow profile ~~then bears with an outer side~~ during the internal high pressure forming. In this case, the tool makes ~~provision for~~ it possible to complete a cutting operation on the hollow profile blank, ~~to be completed~~ before the internal high pressure forming operation starts.

This type of construction or procedure therefore offers the advantage that two method steps, namely the cutting of the flange and the subsequent internal high pressure forming, can be effected in one production step ~~[[in]]~~ using a single tool, thereby ~~resulting in a rationalized production sequence. The simplifying and streamlining the~~ production process ~~is therefore~~

streamlined, which helps to achieve time or cost advantages.

German patent document DE 100 30 882 A1 discloses a
5 precision cutting method and apparatus. In an
~~associated device. To this end, a punching strip, in a~~
first embossing step, a punching strip is supported
against a fixed surface by means of at least one hold-
down, and the ~~subsequent finished part which is to be~~
10 fabricated is pressed at the same time or with a time
delay into an embossing die, preferably against the
spring force of a spring base. In the process, a
sliding surface is produced on the lateral surfaces of
the ~~subsequent finished part~~. In a ~~second parting step~~
15 ~~following~~ Following the embossing step, in a parting
step, the punching strip is ~~thereupon~~ supported on a
fixed surface by at least one hold-down and then the
~~subsequent~~ finished part is cut out with a parting
punch in a parting die.

20 German patent document DE 199 01 304 A1 discloses a
method of processing workpieces. ~~In this case, in which~~
essentially vertically moving processing tools which
act on the work pieces are arranged at at least one
25 station and essentially horizontally moving processing
tools are arranged at at least one further station,
~~these processing tools acting on the workpieces. In the~~
~~process, at~~. At least two workpieces, preferably
arranged axially symmetrically to one another ~~and~~
30 ~~leaving~~ with a clearance space between them are
processed simultaneously in each station. ~~Furthermore~~
In addition, a device suitable for carrying out the
method ~~has been~~ is also disclosed. The device, which is
designed as a press tool for example, makes it
35 possible, ~~for example after the deep drawing of a~~
~~sheet metal workpiece, to carry out the~~ to perform
cutting/perforating operations, ~~following said deep~~

drawing after the deep drawing of a sheet-metal workpiece, on spatially differently oriented surfaces of the workpiece, thereby increasing and ~~thus increase~~ the capacity of the device.

5

German patent document DE 40 35 938 A1 discloses a press tool with multiple movements, having a punch and die which are movable relative to one another due to the movement of the punch. Arranged opposite the punch inside the die is a counter punch which can be moved independently and with a variable force via hydraulic cylinders accommodated in the tool. In addition, ~~or alternatively,~~ a counter die, which may be ~~[[is]]~~ arranged opposite the die, adjacent to the punch in the tool, ~~this counter die likewise being~~ is movable, independently and with a variable force via hydraulic cylinders accommodated in the tool. It is crucial in this case that the counter punch can be moved as part of the tool independently therefrom and with any desired and adjustable force, a factor which defines an additional movement. This counter punch is part of the tool, so a tool with multiple movements is now produced by the additional movement.

25 German patent document DE 101 36 792 A1 discloses a tool for trimming drawn parts.

[[The]] An object of the present invention deals with the problem of specifying is to provide an improved ~~embodiment for a method and a device~~ an apparatus of the type mentioned ~~at the beginning, with which improved embodiment in particular a rationalized~~ described above, which can achieve a simplified production process can be achieved.

35

~~This problem is solved according to the invention by the subject matters of the independent claims.~~

~~Advantageous embodiments are the subject matter of the dependent claims.~~

This and other objects and advantages are achieved by
5 the method and apparatus according to the invention
includes a By means of the positioning device proposed
according to the invention, which improves both the
quality and reproducibility of ~~[[both]]~~ the cutting
operation and the forming operation ~~are improved, the.~~
10 The degree of automation of the cutting and forming
operation ~~[[being]]~~ is also increased ~~at the same time.~~

~~According to a development of the solution according to~~
one embodiment of the invention, the tool has a bottom
15 die and a top die which are displaceable relative to
one another. In this case, either the cutting device is
integrated ~~[[in]]~~ into one of the dies, such that
~~[[and]]~~ the cutting edge then forms an integral part of
the respective die, or ~~[[else]]~~ the cutting edge is
20 designed as a separate component and ~~[[is]]~~ fastened to
one of the dies in a fixed position. Alternatively, or
else the cutting device ~~[[is]]~~ may be arranged on one
of the dies in such a way as to ~~[[be]]~~ have an
adjustable ~~[[in]]~~ stroke.

25 The described variations ~~variants described~~ of the
arrangement of the cutting device on the tool ~~already~~
~~shows~~ evidence the wide range of possibilities that the
invention opens up with regard to process-optimized
30 arrangement ~~variants~~ of the cutting devices. For
example, ~~a design of~~ designing the cutting device as a
separate component which is fastened to one of the dies
in a fixed position offers the advantage that, after a
relatively large number of cutting operations, the
35 cutting device or the cutting edge can be exchanged
simply and quickly and thus the maintenance cost of the
tool can be reduced. If the cutting device is arranged

on one of the dies in such a way as to ~~[[be]]~~ have an
adjustable ~~[[in]]~~ stroke, a markedly smoother mode of
operation of the tool is obtained on account of the
lower weight, ~~to be moved,~~ of the cutting device that
5 must be moved, compared with the top or bottom die. On
the other hand, the integration of the cutting device
~~[[in]]~~ into one of the dies or the design of the
cutting edge as an integral component offers the
advantage that an especially precise and powerful
10 cutting operation can be achieved ~~as a result.~~ Due to
the many possible ways of arranging the cutting devices
on one of the dies, ~~the solution according to the~~
invention ~~therefore~~ makes it possible to react in a
flexible manner to the most varied requirements with
15 regard to the material and/or workpiece to be
processed.

According to a preferred embodiment of the invention,
at least one hold-down, which ~~fixes the flange of the~~
20 ~~hollow profile at least during the cutting operation,~~
is provided in the region of the cutting edge fixes the
flange of the hollow profile at least during the
cutting operation. ~~Such a hold-down, in~~ In combination
with a positioning device which, before and during the
25 cutting and forming operation, presses the hollow
profile against ~~[[that]]~~ the side of the cutting device
which faces the hollow profile, such a hold-down
ensures that the hollow profile is held in a fixed
position during the cutting operation and thus ensures
30 an exact cut of high quality. In addition, the hold-
down provides for always identical positioning of the
hollow profile inside the tool, ~~as a result of which so~~
that a ~~[[high]]~~ highly reproducible dimensional
accuracy, and thus uniformity of the hollow profiles to
35 be produced, are ~~[[is]]~~ achieved.

An embossing punch may ~~expediently~~ also be provided

~~which is~~ displaceable transversely to the longitudinal extent of the hollow profile. In this way, it becomes possible to make and which makes an embossment on the outside of the hollow profile after the forming operation. In ~~this way, the solution according to the invention,~~ in addition to a cutting and internal high pressure forming operation, the invention thus offers the advantage of carrying out an embossing operation virtually simultaneously, but in particular without a tool change, so that a further production step with the tool according to the invention can be integrated in the respective work station. ~~In this case, the~~ The embossing punch may be arranged in such a way that it crosses and passes through the cutting device in a corresponding opening during the embossing operation. In ~~the process~~ this manner, the embossing punch embosses an outer side_{[[,]]} (bearing against the die wall of the cutting device)_{[[,]]} of the hollow profile against the internal high pressure, a factor which leads to especially exact and dimensionally accurate embossing.

According to a further advantageous design feature of the ~~solution according to the invention~~, at least one perforating punch, which is provided coaxially in the embossing punch, ~~coaxially thereto, this perforating punch-perforating~~ perforates the hollow profile after the embossing operation has been completed. According to this embodiment, in addition to _{[[the]]} cutting, internal high pressure forming, and embossing, ~~the perforating perforation~~ can now also be integrated as a further processing step in the same tool, as a result of which time and cost advantages are again obtained. In addition, ~~the solution according to the invention~~ ensures _{[[that]]} high accuracy in the position and shape of the holes produced by the perforating punch ~~have a high accuracy of position and shape,~~ and thus

the quality of the hollow profiles produced can be markedly increased. Compared with previous production methods in which the holes are ~~subsequently~~ made subsequently in the already finish-shaped hollow
5 profiles, subsequent deformation (and thus dimensional inaccuracy) of the hollow profile can [[now]] be avoided. Even in the opposite case, in which [[the]] embossing is ~~effected~~ performed after the production of the holes, the ~~solution according to the~~ invention
10 offers the great advantage that the embossing punch does not adversely affect the dimensional accuracy, ~~that is to say the~~ (position and shape) of the holes produced[[,]] by the embossing. In principle, with the tool according to the invention, first perforating and
15 then embossing can be carried out after the internal high pressure forming, or vice versa.

~~Further important features and advantages of the invention follow from the subclaims, from the drawings and from associated description of the figures with respect to the drawings.~~

20

It goes without saying that the abovementioned features and the features still to be explained below can be
25 used not only in the respectively specified combination but also in other combinations or on their own without departing from the scope of the present invention.

~~Preferred exemplary embodiments of the invention are shown in the drawings and are described in more detail below, identical reference numerals relating to identical or functionally identical or similar components.~~

30

35 ~~In the drawing:~~

Other objects, advantages and novel features of the present invention will become apparent from the following detailed description of the invention when considered in conjunction with the accompanying
5 drawings.

In the figures of the drawings, identical reference numerals are used to designate identical, functionally identical or similar components.

10 BRIEF DESCRIPTION OF THE DRAWINGS

[[fig.]] Fig. 1 shows a cross section through a tool according to the invention with inserted hollow profile, before the cutting or forming operation[[,]];

15

[[fig.]] Fig. 2 shows an illustration as in [[fig.]] Fig. 1, but with actuated positioning device[[,]];

20 [[fig.]] Fig. 3 shows a cross section through the tool according to the invention, after the cutting and forming operation and before the embossing or perforating operation[[,]];

25 [[fig.]] Fig. 4 shows an illustration as in [[fig.]] Fig. 3 but with embossing and perforating operation completed[[,]] and

30 [[fig.]] Fig. 5 shows a cross section through the tool with opened top and bottom die.

DETAILED DESCRIPTION OF THE DRAWINGS

~~According to fig. As shown in Fig. 1, a tool 1~~
 according to the invention, ~~which is designed a tool 1~~
 for cutting a flange 3 on a hollow profile 2, has a
 5 bottom die 7 and a top die 8, which are displaceable
 relative to one another. ~~Here, according to the~~
~~illustrations in figs~~ As seen in Figs. 1 to 5, the top
 die 8 is displaceable toward the bottom die 7. (In
 general, however, it is also ~~conceivable~~ possible for
 10 the bottom die 7 to be displaceable toward the top die
 8 or for both to be mounted in an displaceable manner.)

To cut the flange 3 on the hollow profile 2, the tool 1
 has at least one cutting device 4, which runs parallel
 15 to the longitudinal extent of the hollow profile, has a
 cutting edge 5 and is displaceable transversely
 relative to the ~~hollow profile in the transverse~~
~~direction of the~~ hollow profile 2. ~~In this case, the~~
The cutting device 4 may be integrated in one of the
 20 dies 7 or 8, so that the cutting edge 5 ~~then forming an~~
becomes integral part of the respective die 7 or 8.
 Alternatively, the cutting device 4 may be also be
 designed as a separate component which is fastened on
 one of the two dies 7 or 8, ~~[[here]]~~ (the top die 8 in
 25 Fig. 1), in a fixed position. As a third variant, the
 cutting device 4 may be arranged on one of the dies 7
 or 8 ~~in such a way as to be~~ so that it is adjustable in
 stroke relative to the respective die 7, 8.

~~In the case of a~~ When the cutting device 4 is
 30 integrated ~~[[in]]~~ into one of the dies 7 or 8, the
 flange 3 can be cut off or severed in an especially
 powerful, and thus precise, manner, ~~as a result of~~
~~which~~ and the quality of a subsequent end product ~~[[can~~
 35 be]] is therefore markedly increased. On the other
 hand, the embodiment of the cutting device 4 as a
 separate component~~[[,]]~~ which is fastened on one of the

two dies 7 or 8 in a fixed position, offers the [[great]] advantage that the cutting edge 5, ~~which may be designed,~~ (for example, [[as]] a parting blade), can be exchanged in a simple and cost-effective manner.

5 Hardened metals, for example, which have an especially long service life, are suitable as cutting edge 5. The third ~~embodiment~~ variant, in which the cutting device 4 ~~together,~~ with the cutting edge 5, is arranged in a displaceable manner on one of the dies 7 or 8, offers

10 the advantage that the cutting operation can be ~~isolated~~ separated from a closing operation of the tool 1, i.e. from a movement of the top die 8 and the bottom die 7 toward one another.

15 According to [[fig.]] Fig. 1, a shaping die wall 17 is formed on a side 6 of the cutting device 4 facing the hollow profile 2, ~~the hollow profile 2 bearing which bears~~ against [[this]] the die wall 17 after the cutting operation and during the subsequent internal

20 high pressure forming. In this case, according to the illustrations in [[figs]] Figs. 1 to 5, ~~the tool 1 is designed in cross-section, for example, in such a way that~~ the top die 8 and the bottom die 7 each have an L-shaped ~~form, and these~~ cross section, such that, when

25 they meet, the L-shaped ~~forms, when they meet,~~ portions form a cavity 14 in which the hollow profile 2 can be shaped by internal high pressure. [[This]] The cavity 14 is in this case defined at least on one side by the die wall 17 of the cutting device 4.

30 ~~According to fig.~~ As shown in Fig. 1 and [[fig.]] Fig. 2, a positioning device 9 is provided on the tool 1, ~~which positioning device 9, before.~~ Before the cutting and forming operation, positioning device 9 presses

35 the hollow profile 2 against that side 6 of the cutting device 4 which faces the hollow profile 2[[,]] (that is, [[to say]] against the die wall 17 of the cutting

device 4). ~~In this case, the~~ The positioning device 9 may be designed, for example, as a punch which is acted upon by spring force or hydraulic pressure and which is arranged ~~so as to be~~ extendable and retractable in one of the dies 7 or 8, ~~here in~~ (the bottom die 7 in the drawings). ~~According to fig.~~ In Fig. 2, the positioning device 9 is actuated and, in the actuated state, presses the hollow profile 2 against the side 6 of the cutting device 4.

10

~~Provided in the region of the cutting edge 5 is at~~ At least one hold-down 10 is provided in the region of the cutting edge 5, and ~~[[which]]~~ fixes the flange 3 of the hollow profile 2 ~~at least~~ during the cutting operation. ~~According to the illustrations~~ As illustrated in ~~[[figs]]~~ Figs. 3 and 4, a second hold-down 10' can also be provided by a stepped design of the cutting edge 5, ~~this second hold-down 10' fixing to fix~~ the hollow profile 2 in position during the forming operation or embossing and perforating operation following the cutting operation.

15
20

~~According to the illustration in fig.~~ As also shown in Fig. 3, an embossing punch 11 is provided which is displaceable transversely to the longitudinal extent of the hollow profile 2 and provides an embossment (cf. ~~[[fig.]]~~ Fig. 4) on the outside of the hollow profile 2 after the forming operation. ~~In this case, the~~ The embossing punch 11 ~~[[can]]~~ is preferably ~~[[be]]~~ actuated hydraulically, and acts during the embossing against an internal high pressure p_i which prevails inside the hollow profile 2. The embossing punch 11 may expediently be arranged in such a way that it crosses and passes through the cutting device 4 in a corresponding opening 12 after the cutting operation and during the embossing operation. During the cutting operation, the embossing punch 11 moves with the

25
30
35

cutting device 4 or the top die 8 transversely to its embossing direction. It is ~~conceivable in this case possible~~, for example, for an embossing surface 15 formed on the end face of the embossing punch 11 to be
 5 part of the shaping die wall 17 of the cutting device 4.

As mentioned above, the embossing of the hollow profile 2 is effected against the internal high pressure p_i and
 10 after the cutting operation, so that, with the embossing, an additional but facultative processing step can be carried out with the tool 1.

According to ~~[[figs]]~~ Figs. 3 and 4, at least one
 15 perforating punch 13, which perforates the hollow profile 2 after the completed embossing operation, is provided disposed coaxially in the embossing punch 11 and ~~coaxially thereto~~. An embossing direction of the embossing punch 11 is in this case parallel to a
 20 direction of movement of the perforating punch 13. ~~Due to the~~ The tool according to the invention~~[[,]]~~ thus makes it possible to integrate a further likewise facultative processing step, namely the perforating of the hollow profile 2, ~~is integrated in~~ into the tool 1
 25 itself, ~~as a result of which~~ so that the production process ~~[[per se]]~~ can be greatly rationalized.

In addition, the embossing or the perforating against the internal high pressure p_i offers the advantage that
 30 embossments produced beforehand are not adversely affected by the perforating or perforations ~~produced beforehand are not adversely affected by the embossing~~ on account of the internal high pressure p_i , so that a high quality of the hollow profiles 2 produced can be
 35 achieved.

One possible method of cutting the hollow profile 2 or of forming, embossing and/or perforating the hollow profile 2 is to be briefly explained below:

5 ~~According to fig.~~ As shown in Fig. 1, the hollow profile 2 (at this stage is still a hollow profile blank, not designated in any more detail) is inserted into the tool 1, with the two dies 7 and 8 being in the open state~~[[,]]~~ (that is, to say being positioned at a
 10 ~~distance from one another).~~ After the insertion of the hollow profile 2, which at this stage is still a hollow profile blank (not designated in any more detail), the positioning device 9, according to fig. Thereafter, as shown in Fig. 2, the positioning device 9 pushes the
 15 hollow profile 2[[,]] (still before the cutting and forming operation), against that side 6 of the cutting device 4 which faces the hollow profile 2[[,]] (that is [[to say]] against the die wall 17). During the positioning, the tool, according to ~~[[fig.]]~~ Fig. 2, is
 20 still in a partly open state, so that a simple adjustment of the hollow profile 2 in the direction of the cutting device 4 is possible.

The cutting operation is effected after the
 25 positioning. To this end, according to ~~[[fig.]]~~ Fig. 3, the top die 8 moves ~~towards~~ toward the bottom die 7 and cuts off the flange 3 of the hollow profile 2 by means of the cutting edge 5, situated at the front on the cutting device 4 in the direction of movement. ~~At least~~
 30 ~~during~~ During the cutting operation, at least one hold-down 10 arranged in the region of the cutting edge 5 fixes the flange 3 of the hollow profile 2. After the cutting operation has been completed, a second hold-down 10' fixes the remaining flange stub of the hollow
 35 profile 2 and thus fixes the hollow profile 2 in its position. After the cutting operation, cutting scrap (not shown) falls through an ejection shaft 16, which

according to ~~[[figs]]~~ Figs. 1 to 5 runs out vertically in the bottom die 7 in the direction of movement of the cutting device 4.

5 ~~[[It]]~~ As can be seen from ~~[[figs]]~~ Figs. 2 and 3, ~~that~~
~~the cutting of~~ the flange 3 is effected cut by the
closing of the tool 1~~[[,]]~~ (that is, ~~[[to say]]~~ by a
movement of the top die 8 toward the bottom die 7). It
is also ~~conceivable~~ possible in this case for the
10 cutting operation to be effected only after the closing
of the tool~~[[,]]~~ (that is, ~~[[to say]]~~ when the top die
8 bears against the bottom die 7), by a cutting device
4 which is adjustable in stroke and is designed, for
example, as a separate component.

15 After completion of the cutting operation, the hollow
profile blank 2' is formed by internal high pressure
forming and in the process changes in size and form in
accordance with the illustration in ~~[[fig.]]~~ Fig. 3.
20 During the internal high pressure forming, the
positioning device 9 is actively shifted back or
passively thrust back to a corresponding extent~~[[,~~
~~that]]~~. That is, ~~[[to say]]~~ the holding or positioning
force of the positioning device 9 is ~~(markedly)~~
25 significantly smaller than the forces which occur
during the forming and which widen the hollow profile
2.

After ~~[[the]]~~ forming of the hollow profile 2, an
30 embossing punch 11, which is displaceable transversely
to the longitudinal direction of the hollow profile 2
can make an embossment on the outside of the hollow
profile 2 according to ~~[[fig.]]~~ Fig. 4. ~~In this case,~~
~~such~~ Such an embossing operation is optionally
35 selectable. Embossing is effected according to ~~[[fig.]]~~
Fig. 4 by the embossing punch 11 moving transversely to
the longitudinal extent of the hollow profile 2 through

the opening 12 in the cutting device 4 and embossing a recess in an outer wall of the hollow profile 2 by means of the embossing surface 15 provided at the front in the embossing direction.

5

In addition ~~[[to]]~~ (or as an alternative) to the embossing operation, a perforating punch 13 arranged coaxially in the embossing punch 11 ~~coaxially thereto~~ can perforate the hollow profile 2 after the embossing operation has been completed. ~~(cf. fig. See Fig. 4.)~~ ~~[[.]]~~ To this end, the perforating punch 13 travels transversely to the direction of movement of the cutting device 4 and parallel to the embossing direction of the embossing punch 11 and pierces an outer wall of the hollow profile 2. According to ~~[[figs]]~~ Figs. 3 and 4, ~~in each case~~ one perforating punch 13 is provided ~~[[here]]~~. However, it is also possible for a plurality of perforating punches 13 to be arranged. It is also conceivable for perforating to be effected without embossing of the hollow profile 2. On account of the embossing punch 11 or perforating punch 13 acting against the internal high pressure p_i , it is possible to carry out both the embossing and the perforating on the hollow profile 2 without these processing steps adversely affecting one another as in a conventional method of production in a plurality of steps.

~~In this case, the~~ The embossing surface 15 of the embossing punch 11, ~~this embossing surface 15~~ being arranged by way of example in the opening 12 of the cutting device 4, may form part of ~~[[that]]~~ the side 6 of the cutting device 4 which is designed as a shaping die wall 17. However, it is also conceivable for the opening 12 not to open until during an embossing or perforating operation and for it to be closed during the cutting operation or during the forming operation,

~~as a result of which~~ so that the shaping die wall 17 is formed completely by that side 6 of the cutting device 4 which faces the hollow profile 2.

5 ~~According to fig.~~ In Fig. 5, the tool 1 is opened after the cutting and forming, ~~operation and/or~~ embossing ~~operation~~ and/or perforating ~~operation~~ operations by moving the top die 8 ~~moving~~ away from the bottom die 7. In the process, the embossing punch 11 and also the
10 perforating punch 13 are retracted into the tool 1 or the cutting device 4 at least to such an extent that the two dies 7 and 8 can move apart without any problems and the hollow profile 2 can be removed from the tool 1.

15 In summary, the ~~essential~~ features of the ~~solution~~ ~~according to~~ the invention can be characterized as follows:

20 [[In a]] A tool 1 which is designed for cutting a flange 3 of a hollow profile 2 and for forming the hollow profile 2 ~~according to the~~ by an internal high pressure forming process, ~~the invention makes provision for~~ includes a cutting device 4 which has a cutting
25 edge 5, runs parallel to the longitudinal extent and can be displaced in the transverse direction of the hollow profile 2. A ~~and in which~~ a side 6 of the cutting device facing the hollow profile 2 is designed as a shaping die wall 17, against which the hollow
30 profile 2 bears during the internal high pressure forming after the cutting operation. The invention thus enables a plurality of processing steps to be combined, for example the trimming, the forming, the embossing and the perforating of the hollow profile 2,
35 [[in]] at one production station, ~~so that, with.~~ With the tool 1 according to the invention, a plurality of processing steps hitherto separate from one another can

be effected promptly and without removal of the hollow profile 2 from the tool 1. In addition, the processing steps of embossing and perforating can be carried out optionally, so that cutting of the flange 3 and
5 subsequent forming and/or subsequent embossing and/or subsequent perforating can be carried out with the tool 1 according to the invention.

That provision of the side 6 of the cutting device 4
10 which is designed as a shaping die wall 17, permits
~~provides for~~ multifunctional use of the cutting device 4, ~~the cutting device 4 being~~ which can therefore be
simple to realize from the design point of view and at the same time ~~constituting~~ constitute an especially
15 successful design solution. In addition, [[due to]]
because the embossing punch 11 or perforating punch 13 acting acts against the internal high pressure p_i , exact
embossing or perforating of the hollow profile 2 can be ~~effected~~ achieved, during which the embossing and the
20 perforating do not adversely affect one another. As
result, so that an end product of high quality can be achieved ~~overall~~.

The foregoing disclosure has been set forth merely to
25 illustrate the invention and is not intended to be
limiting. Since modifications of the disclosed
embodiments incorporating the spirit and substance of
the invention may occur to persons skilled in the art,
the invention should be construed to include everything
30 within the scope of the appended claims and equivalents
thereof.
